PAC1500 three-phase counters, 7KT1 5

Overview

PAC 1500 three-phase counter with direct connection up to 80 A and transformer current connection ... /5 A

The E-counters (power meters) are used to record the amount of electrical energy exported or imported. Siemens compact E-counters are designed as modular devices for alternating current and can be mounted on standard mounting rails. They comply with the counter standard EN 50470 (Part 1 and 3) and come with an LCD display.

Three-phase counters for direct connection are available up to 80 A and in versions with transformer connections (.../5 A to 10000/5 A).

E-counters store both active and reactive energy, and comply with accuracy class 1 (for active energy).

All E-counters have a pulse output (S0) and are designed for 2-tariff measurements. The calibrated versions are in accordance with the new Measuring Instruments Directive 2004/22/EC (MID).

At the same time the E-counters have an integrated optical interface (IrDA) for connecting communication modules, which enables their integration in a range of other systems, such as energy management systems.

Technical specifications

	Bar diagram (in percent of I_max)
	Device name and approval data
	LED accuracy check indicator
●	Control button

Operation

The large number of measured quantities makes it necessary to present the data in 2 display levels:

- A) Default and
- B) E-counter states

A) Default display level

- The default display level shows the sum of the active and reactive energy:
 - Sum of active energy (E1-E2+E5-E6)
 - Sum of reactive energy (E3-E4+E7-E8)
 - Software version
 - Checksum
- The various measured quantities can be called up with a brief press of the control button.
- A 3-digit display indicates the instantaneous power. A bar display indicates the instantaneous current in steps of 10 % in relation to the maximum load rating (I_{max}) (transformer connection in relation to $I_{secondary}$). The bar display is updated every 2 s.
- Note:
In this display level the symbol indicator (import/export) refers to the current power and not to the energy consumption value.

Display test control button

- If the control button is pressed and held for longer than 10 s, a display test will be activated.
- This test takes 30 s to complete. The DEFAULT display level then appears.

B) E-counter states display level

- This display level presents the energy values E1 to E8.
- To switch to the E1 to E8 energy values, press and hold the control button until the red LED lights up (approx. 4 s). The power indicators go out and the display shows the energy values E1-E8.
- A brief press of the control button enables these measured values to be shown in a loop.
- To return to the default display level, press and hold the control button for approx. 4 s or wait approx. 30 s for automatic switch-over to the initial display.
- To view all the energy registers per phase (active and reactive energy for absorbed and generated energy for T1 and T2) in a loop, press the control button for 2 s.
- The display lighting is switched off automatically after 40 s of inactivity.

Resetting all energy registers

- If the control button is pressed and held for longer than 20 s, the word "rESEt" will appear.
- After the control button is pressed again for at least another 4 seconds, all the energy registers are set to ZERO.

PAC1500 single-phase counters, 7KT1 14, 7KT1 53

Overview

PAC1500 single-phase E-counters:
left: Digital 7KT1 53 e-counter
right: E-counters for active energy 7KT1 140

The E-counters (power meters) are used to record the amount of electrical energy exported or imported. Siemens compact E-counters are designed as modular devices for alternating current and can be mounted on standard mounting rails. They comply with the counter standard EN 50470 (Part 1 and 3) and come with an LCD display.

The PAC1500 single-phase counters for direct connection are available up to 80 A. They store both active and reactive energy and all comply with accuracy class 1 (for active energy).

All E-counters have a pulse output (S0) and are designed for 1-tariff or 2-tariff measurements depending on the version. The calibrated versions are in accordance with the new Measuring Instruments Directive 2004/22/EC (MID).

At the same time the E-counters – except version 7KT1 140 – have an integrated optical interface (IrDA) for connecting communication modules. Integration of the E-counters, e.g. in energy management systems, is thus possible.

More information

Digital 7KT1 53, single-phase E-counters, illustration of display

- Green, backlit LCD
- The control button is used to select the different display levels.

Operation

The large number of measured quantities makes it necessary to present the data in 2 display levels:

- Default
- E-counter states

A) Default display level

- The default display level shows the sum of the active and reactive energy:
 - Sum of active energy (E1-E2 for 7KT1 530 and E1-E2+E5-E6 for 7KT1 531, 7KT1 533)
 - Sum of reactive energy (E3-E4 for 7KT1 530 and E3-E4+E7-E8 for 7KT1 531, 7KT1 533)
 - Software version
 - Checksum
- The various measured quantities can be called up with a brief press of the control button.
- A 3-digit display indicates the instantaneous power. A bar display indicates the instantaneous current in steps of 10 % in relation to the maximum load rating (I_{max}). The bar display is updated every 1 second.
- Note:
In this display level the symbol indicator (import/export) refers to the current power and not to the energy consumption value.

Display test control button

If the control button is pressed and held for longer than 10 s, a display test will be activated.

This test takes 30 s to complete. The DEFAULT display level then appears.

B) E-counter states display level

- This display level presents the energy values E1 to E8.
- To switch to this display level, press and hold the control button until the red LED lights up (approx. 4s). The power indicators disappear and the display shows the energy values E1-E8.
- A brief press of the control button enables the loop display of these measured values.
- To return to the default display level, press and hold the control button for 4 seconds.
- The display lighting is switched off automatically after 40 s of inactivity.

Resetting of all energy registers (except for 7KT1 533)

If the control button is pressed and held for longer than 20 s, the word "rESEt" will appear.

Pressing the control button again for at least another 4 seconds, resets all the energy registers to ZERO.

Overview

PAC3000 multimeters

Multimeters are mainly used in power distribution boards for infeeds into buildings and plants. They replace the more common analog voltmeters and ammeters with measuring point changeover, as well as measuring devices for power outputs and power factor p.f..

The standard measured quantity to be indicated in the 5 display fields of the multimeter can be tailored to customer requirements. Versions for direct connection (63 A) or for transformers (/5 A) with adjustable transformer primary current from 5 A to 5000 A, enable a wide range of application.

The green 7-segment displays for the measured values and the orange indicators of the units of measurement directly alongside the measured values make for easy reading.

Instructions for the connection of transformer counters

In the case of cross-section reduction, a short-circuit resistant cable is required for the power supply of terminal 2, depending on the fusing for phases L1, L2, L3. A fuse of 6 A is recommended for line protection.

Current transformers must not be operated with open terminals as this can result in dangerously high voltages, which may cause personal injury and/or property damage. It can also lead to a thermal overload of the transformers.

Measuring Devices and E-counters

Power monitoring devices

PAC3000 multimeters, 7KT1 30

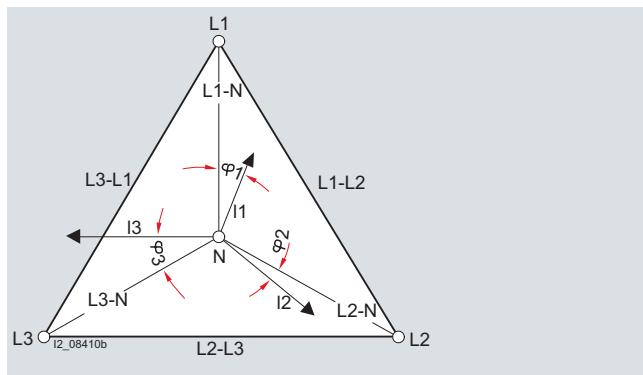

More information

Voltage measurement

The multimeter measures the delta voltages L1 against L2; L2 against L3 and L3 against L1 or the star voltages L1, L2, L3 against N.

ΣL symbol for the three-phase system

This indicates that all physical units shown under this symbol are always 3-phase.

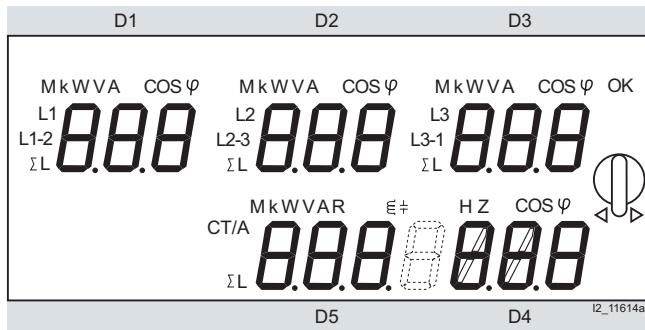

Readout data

You can continuously display 5 measured quantities from the following 23 options.

No.	Measured value	Display	Unit	Assignment
1	Active power	D1	W	L1
2	Voltage	D1	V	L1
3	Current	D1	A	L1
4	Apparent power	D1	VA	L1
5	P.f.	D1	P.f.	L1
6	Voltage	D1	V	L1 – L2
7	Active power	D2	W	L2
8	Voltage	D2	V	L2
9	Current	D2	A	L2
10	Apparent power	D2	VA	L2
11	P.f.	D2	P.f.	L2
12	Voltage	D2	V	L2 – L3
13	Active power	D3	W	L3
14	Voltage	D3	V	L3
15	Current	D3	A	L3

17	P.f.	D3	P.f.	L3
18	Voltage	D3	V	L3 – L1
19	Active power	D1, D2, D3, D5	W	ΣL
20	Apparent power	D1, D2, D3, D5	VA	ΣL
21	Reactive power	D5	var	ΣL
22	Frequency	D4	Hz	ΣL
23	P.f.	D1, D2, D3, D4	P.f.	ΣL
2 set values are also indicated:				
24	Transformer setting	D5	CT/A	/5
25	Transformer setting	D5	CT/A	5 ... 5000

Displays

The multimeters have a covered, brightly lit LED display. The measured values are indicated on an 11-mm high, green, 7-segment LED, the physical units are indicated by orange text abbreviations. Both colors are easier to recognize than the red LEDs used for conventional displays. Capacitive loads are automatically indicated by a capacitor symbol, inductive loads by a coil symbol – also in orange.

Matrix selection

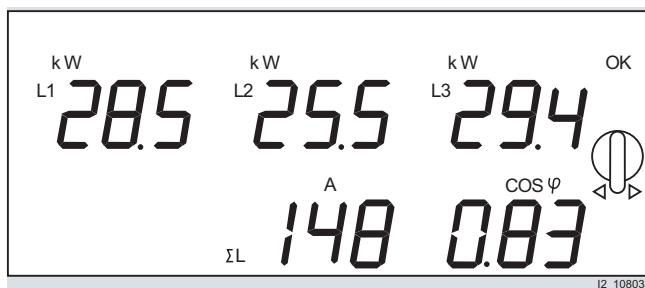

Conventional measuring instruments display voltages, currents, powers, etc. in a rigid sequence on several "screens". These multimeters allow users to define their own standard for measured quantities per display field, so that they can be implemented far more universally and flexibly.

A special feature is the analysis of the different loads on the phases. Phase displacement and unsymmetrical or unbalanced loads can cause partial overloads. These multimeters offer a range of different options for combining and assessing measured values.

The display fields are selected using rotary pushbuttons and the desired indications confirmed with OK. By making the horizontal selection e.g. W V A or p.f., and the vertical selection, e. g. L1, L1-L2 or ΣL , users can then define the desired measured quantities for this display field.

The vertical data on the display can be assigned to any measured value in the horizontal data. The letters M(ega) and k(ilo) are automatically assigned according to measuring range, i.e. measured value, e.g. kW or MW. Capacitive loads are automatically indicated by a capacitor, inductive loads by a coil.

The following diagram shows an example of what your matrix selection might look like.

Overview

Multicounter PAC3000

Multicounters are mainly used in power distribution boards for infeeds into buildings and plants. They replace the more common analog voltmeters and ammeters with measuring point changeover, as well as measuring devices for power outputs and power factor p.f.

The standard measured quantity to be indicated in the 6 display fields of the PAC3000 multicounter can be tailored to customer requirements. The measured values of all measured quantities can also be displayed quickly and easily over the operator buttons. Versions for direct connection (63 A) or for transformers (/5 A) with adjustable transformer primary current from 5 to 5000 A, enable a wide range of application.

The green 7-segment displays for the measured values and the orange indicators of the units of measurement directly alongside the measured values make for easy reading.

Dimensional drawings

Schematics

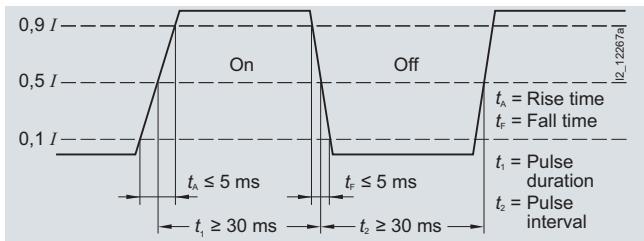

S0 interface

The S0 interface is a current interface for pulse transmission between a counter with integral pulse generator device and tariff rate device.

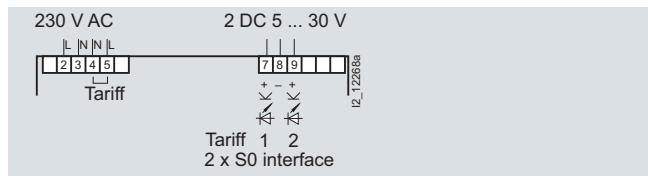

The tariff rate device is connected to the S0 interface of the counter over a 2-wire conductor and - acting as a passive electrical two-pole - supplies the pulse generator with a direct voltage.

The following diagram shows the dependency of the current path on the time according to DIN 43864.

The following diagram shows the pulse output (S0 interface) for a 2-tariff counter: e.g. rate 1 → normal rate, rate 2 → special rate.

For pulse recording with devices from other manufacturers (pulse counters or digital inputs), a voltage within the range of 5 to 30 V DC must be applied to the output terminals of the S0 interface. The optocoupler operates as the switch. In order to prevent overloading, the current must not exceed a max. of 20 mA.

Grounding terminal

The interpolation point grounding terminals required for transmission technology only serve to shield the transmission cables and do not have a protective function.

Instructions for the connection of transformer counters

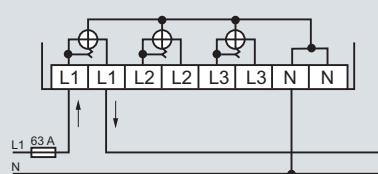

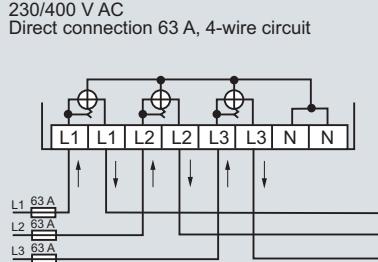

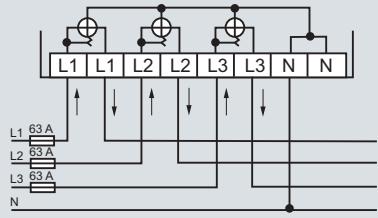

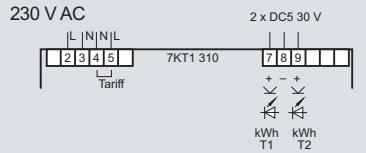

In the case of cross-section reduction, a short-circuit resistant cable is required for the power supply of terminals 2, 5 and 8, depending on the fusing for phases L1, L2, L3. A fuse of 6 A is recommended for line protection.

Current transformers must not be operated with open terminals as this can result in dangerously high voltages, which may cause personal injury and/or property damage. It can also lead to a thermal overload of the transformers.

More information

Communication interfaces

Multicounters with Modbus interface

The Modbus RTU is a very common communications solution. It is a serial, asynchronous form of communication, which requires RS 485 networks as the hardware platform. RS 485 networks can be set up with 2-wire copper or optical fiber cables and, compared to the RS 232 serial interface, offer fast transmission rates.

In a Modbus network, each bus station has a bus address within the range from 1 to 255. All stations within a network must be set to the same transmission rate. We recommend transmission rates of 9600 or 19200 bit/s. The address and transmission rate can be set in the user menu of the multicounters.

In order to customize a Modbus installation, it is necessary to implement the appropriate software application for the master. This requires specific information about communication with multicounters. For more information please visit us on the Internet at: www.siemens.com/beta

Multicounters with LAN coupler on LAN

The 7KT1 391 LAN couplers support connection of up to thirty 7KT1 34 multicounters to a LAN network. The LAN server and the multicounters are interlinked over an RS 485 network. Setting the bus address in the 7KT1 34 multicounters to "0" specifies that it is operating in "LAN" mode.

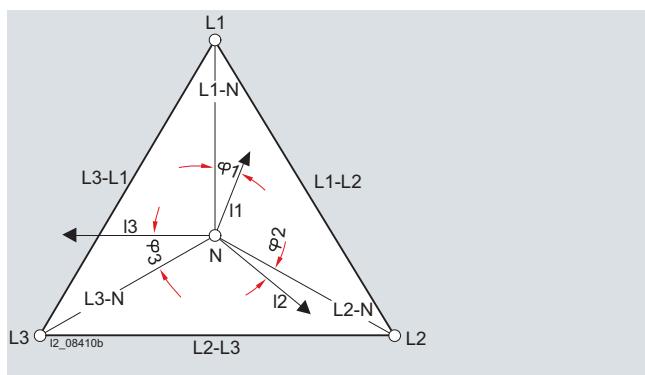

More information about LAN operation can be found at 7KT1 391. LAN couplers.

Voltage measurement

Depending on the selected connection type, the multimeter measures the delta voltages L1 against L2; L2 against L3 and L3 against L1 or the star voltages L1, L2, L3 against N.

ΣL symbol for the 3-phase system

This indicates that all physical units shown under this symbol are always 3-phase.

Temperatures

The temperature information of the multimeter is not suitable for an exact measurement of the ambient temperature. The device does not have a temperature sensor. It is also not possible to connect an external temperature sensor.

The temperature information merely enables a rough estimate of the temperature conditions in the device interior and immediate vicinity.

Readout data

You can continuously display 6 measured quantities from the following 35 options.

No.	Measured value	Display	Unit	Assignment
1	Active power	D1	W	L1

Overview

7KT 391 LAN couplers

A LAN coupler supports worldwide data recall from multi-counters and E-counters over a LAN link to the Internet.

Up to 30 devices can be linked with a LAN coupler. In turn, the LAN coupler is connected to a LAN.

Data communication between the LAN coupler and the PC takes place using the TCP/IP protocol.

Diagram

Grounding potential

Both the LAN cable with the RJ45 connector and the shielded cable of the RS 485 bus system must be grounded. This also applies to the devices connected to the LAN coupler.

Connecting the devices to the LAN coupler

All the devices are connected in parallel with a shielded two-wire cable. Point-to-point installations, junctions or ring installations are not possible.

More information

Connection of the LAN coupler to a LAN

Each station in a LAN must be assigned its own IP address. On delivery, or after a reset, the LAN coupler has a standard IP address. The new IP address must be set in the LAN coupler during commissioning. This entails connecting the LAN coupler directly to a PC using a so-called "cross-over" cable. This direct connection can then be used to set a new IP address as well as other network parameters such as a subnet mask and a default gateway in the LAN coupler. The LAN coupler must then be connected to the target system as communication is subsequently only possible with the new settings.

Connection of measuring devices to the LAN coupler

E-counters and multicounters are connected to the LAN coupler via their communication interface. The network is an RS 485 network in which devices are connected over a shielded two-wire cable. When using Modbus, the device address and transmission rate must be set in the multicounters.

The LAN coupler carries out a so-called "polling" during runtime. This cyclically retrieves the most recently gathered measurement data from the measuring devices and buffers them in the LAN coupler. This can then be called up at any time over the LAN.

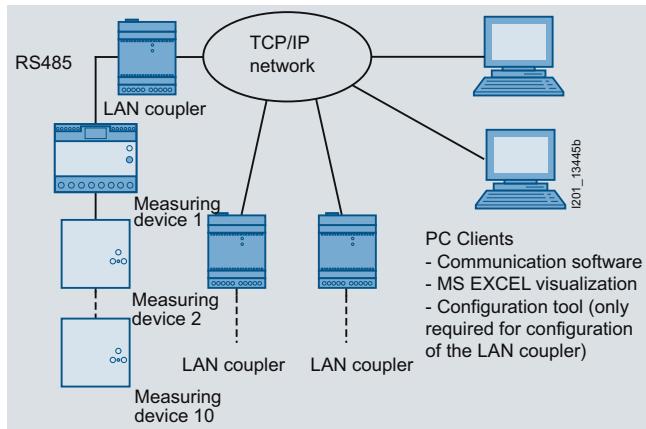

Data transmission from LAN coupler to PC

This data transmission is PC-controlled. The software tool LAN-Sync runs on the PC in the background.

More information can be found on the Internet at www.siemens.com/beta

Display of measurement data on the PC

The measurement data can be shown on the PC using a web browser.

Measuring Devices and E-counters

Power monitoring devices

PAC3100, PAC3200 and PAC4200
power monitoring devices

Application

Three-phase power monitoring devices are used to measure and indicate all relevant network parameters of an electrical installation and they monitor these parameters permanently.

Applications

Wherever power has to be distributed, be it in industrial or infrastructural buildings, the SENTRON PAC supplies important information to the building services system or the power controlling system.

The many different communication options offered by the SENTRON PAC make it an indispensable supplier of data for power management systems and for plant and building automation.

Industries

Power distribution systems for the power supply are needed in all sectors of industry. SENTRON PAC is used accordingly in all sectors where power consumption and electrical parameters are to be measured.

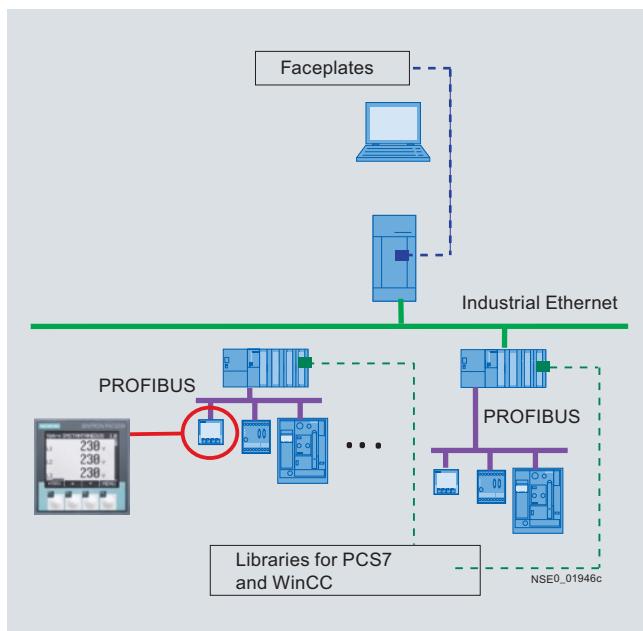

Integration of PAC3200 and PAC4200

When the SENTRON PAC3200 and PAC4200 are fully integrated in a power management system, they monitor the power consumption and help to monitor the operating state of the plant. Measured values, limit value violations, operating hours of a connected load or power flows are supplied by the instruments quickly and reliably.

Using the optionally available interface modules, it is possible to integrate both instruments in every I&C system or every SIMATIC S7 environment.

System integration using function block libraries

Optionally available function block libraries make it easy to integrate the power monitoring devices in the SIMATIC PCS 7 process control system and the SCADA-System SIMATIC WinCC. Together with the faceplates as user interface for SENTRON PAC3200, the driver blocks and diagnostics blocks in the control system enable the operating and monitoring of technologically important values and functions of the measuring devices in the respective target system.

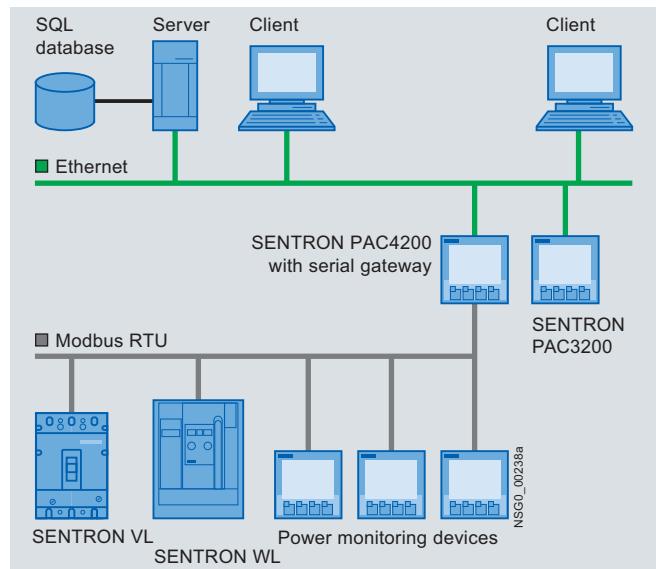

Integration of the SENTRON PAC3200 in SIMATIC PCS 7/WinCC

System integration of RS 485 field bus devices through Ethernet

A special feature is the integrated gateway function of the SENTRON PAC4200. It enables a cost-effective and simple connection of devices with an RS 485 interface to an Ethernet network.

Everything required is provided by the SENTRON PAC RS485 expansion module, to which a maximum of 31 lower-level devices can be connected without a repeater and as many as 247 with a repeater.

The gateway function of the SENTRON PAC4200 supports the Modbus protocol and can be parameterized using SENTRON powerconfig.

Connecting Modbus-RTU devices to a power management system through PAC4200

Measuring Devices and E-counters

Power monitoring devices

PAC PROFIBUS DP expansion modules

Overview

SENTRON PAC PROFIBUS DP expansion modules

The PAC PROFIBUS DP expansion module has the following features:

- Pluggable PROFIBUS DP communication modules for SENTRON PAC3200 and PAC4200 power monitoring devices
- Parameterizable from the front of the device or using parameterization software
- Using PROFIBUS DP-V1, data can be transferred in both cyclic and acyclic modes
- Easy engineering thanks to integration into SIMATIC STEP 7 and/or simple integration via GSD file for other programming systems
- Optimum use of a control system's process image for selection of individual measured values for cyclical transfer
- all baudrates from 9.6 kbit/s up to 12 Mbit/s are supported
- Connection through 9-pole Sub-D connector according to IEC 61158
- No external auxiliary power necessary
- Additional display via the device display and via LEDs on the module

Application

The SENTRON PAC PROFIBUS DP communication module is plugged onto the rear of the power monitoring device. The device identifies the module automatically and presents the parameters of relevance for this module for selection in the parameterization menu.

All individual measured values supplied by the SENTRON PAC power monitoring devices are selected and cyclically transmitted by means of the GSD file. This permits the optimum use of the PROFIBUS Master process image.

PAC RS485 expansion modules**Overview**

SENTRON PAC RS485 expansion module

The SENTRON PAC RS485 expansion module has the following features:

- PAC RS485 plug-in communication module for SENTRON PAC3200 and PAC4200 power monitoring devices
- Parameterizable from the front of the device or using parameterization software
- Support for the Modbus RTU protocol
- Plug and play
- Baud rates 4.8 / 9.6 / 19.2 and 38.4 kbit/s are supported.
- Connection by means of 6-pole screw terminals
- No external auxiliary power necessary
- Status indication by LED on the module

Application

The SENTRON PAC RS485 communication module is plugged into the back of the PAC power monitoring device.

The device identifies the module automatically and presents the parameters of relevance for this module for selection in the parameterization menu. The state of the module is indicated by the integrated LED.

In connection with the SENTRON PAC3200 and 4200 power monitoring devices, the Modbus RTU protocols are supported with baud rates of 4.8/9.6/19.2 and 38.4 kBd.

The SENTRON PAC RS485 expansion module is required for the gateway function of the PAC4200 to achieve simple devices with RS 485 interface, such as the PAC3100, via Ethernet (Modbus TCP).

Measuring Devices and E-counters

Power monitoring devices

PAC 4DI/2DO expansion modules for PAC4200

Overview

SENTRON PAC 4DI/2DO expansion modules

The SENTRON PAC 4DI/2DO expansion module is used to expand the SENTRON PAC4200 power monitoring device to up to 10 digital inputs and 6 digital outputs. It offers the following features:

- Up to two 4DI/2DO modules can be plugged onto a PAC4200.
- The 4DI/2DO modules mean that the internal digital inputs and outputs can be expanded by up to 8 inputs and 4 outputs.
- The 4DI/2DO expansion modules can be parameterized via the front of the device or via the SENTRON powerconfig configuration software.
- The digital inputs can be used without external voltage sources. They are self-powered.
- All functions of the integrated multifunctional inputs/outputs on the PAC4200 are also available in the 4DI/2DO expansion module.
- Inputs and outputs can be used as an S0 interface conforming to IEC 62053-31.
- The connection is made via a 9-pole screw terminal.
- No external auxiliary power supply is required.

Application

There are many possible uses for the SENTRON PAC 4DI/2DO expansion module. Some of these include:

- Connection of up to 10 energy counters with pulse output (S0) for detecting the consumption of other energy-carriers e.g. gas, water or compressed-air consumption
- Integration of other media into energy management system

- Monitoring of multiple, single switches with auxiliary contacts via PAC4200
- Use of the digital outputs as pulse output for active and reactive energy
- Use of the digital outputs as outputs for switching operations and/or for time synchronization.

7KT1 0 measuring devices

Overview

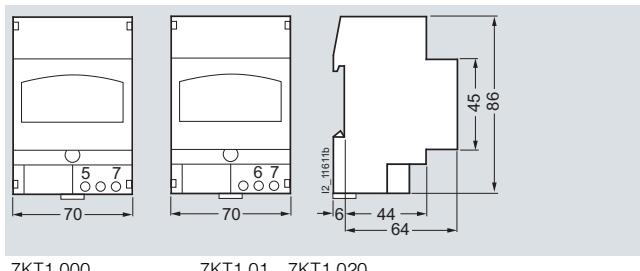

These devices for measuring voltages and currents can be used for monitoring incoming and outgoing currents or device currents in electric plants. They are suitable for direct connection in a single-phase system or with selector switches for the measured values in three-phase systems.

Digital volt- and ammeters

7KT1 11, 7KT1 12 measuring devices

Overview

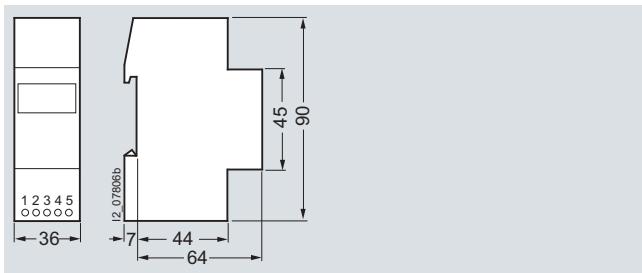

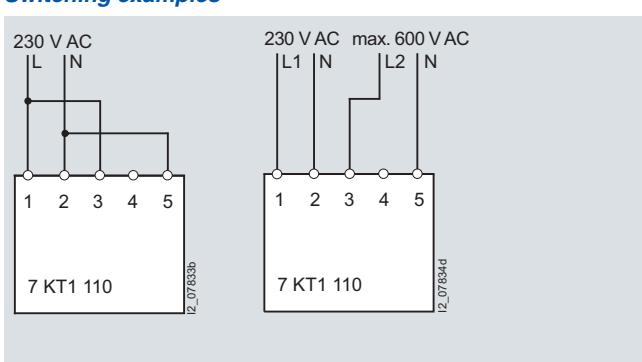

Measuring devices 7KT1: Left voltmeter, right ammeter

These devices for measuring voltages and currents can be used for monitoring incoming and outgoing currents or device currents in electric plants. They are suitable for direct connection in a single-phase system or with measuring transducers in three-phase systems.

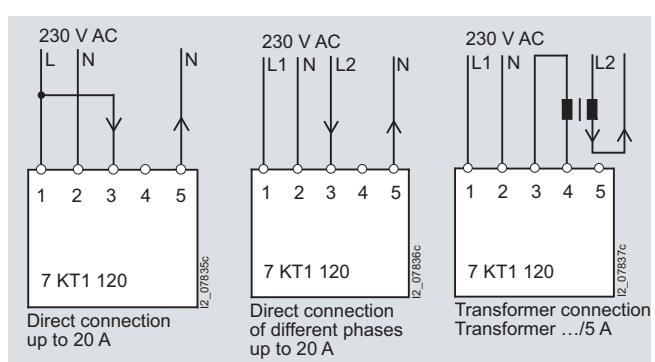

The measuring ranges of the ammeter are set at the device with a coding switch.

Measuring Devices and E-counters

Time and pulse counters

Time and pulse counters for standard rail mounting, 7KT5 8

Overview

Time counters: Left: electromechanical, right: electronic

Time and pulse counters are used for the reliable monitoring of production and service times, which enables the exact planning and monitoring of production sequences, maintenance cycles and warranty times.

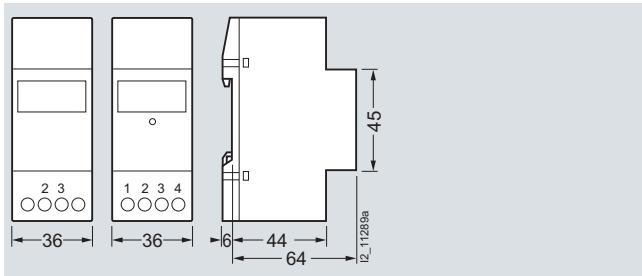

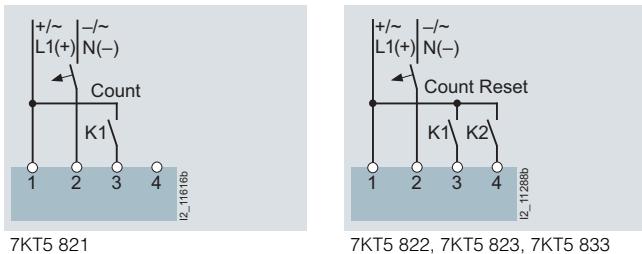

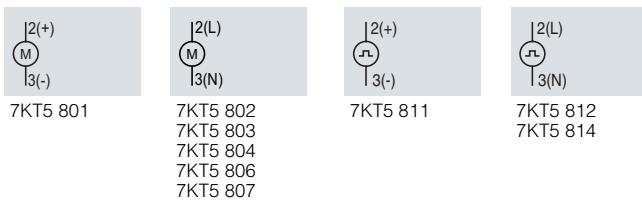

As well as the proven electromechanical time and pulse counters for mounting in distribution boards, we also supply digital time and pulse counters.

The fields of application for both counter types are very diverse, such as the recording of operating hours of machines, systems or building management systems, as well as pulse counting for general volume flow counting, registration of starting frequencies, starting cycles or production quantities in systems and machines.

7KT5 81. 7KT5 833**Schematics****Connections****More information**

Time counters count the time in hours with an accuracy of two decimal places (hundredths of hours). The pulse counter adds the number of pulses, e.g. the making operations of devices.

A power supply is required at terminals 1 and 3 of the electronic counters so that the device can constantly display the measured values. Once terminal 3 is supplied with voltage (for DC "+"), the

counting procedure starts. If terminal 4 is supplied short-time with voltage (for DC "+"), the counter is reset.

In the case of electronic counters, the counting result is saved indefinitely in the event of a power failure (EEPROM). On recovery of the power, the counting is continued from the saved value. As well as a modern design, the electronic counter has a 7-digit LCD, which can be reset electrically or manually.

Measuring Devices and E-counters

Time and pulse counters

Time counters for front-panel mounting,
7KT5 5, 7KT5 6

Overview

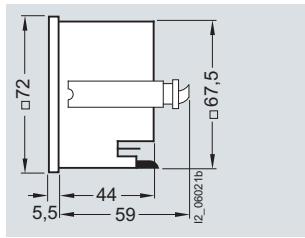

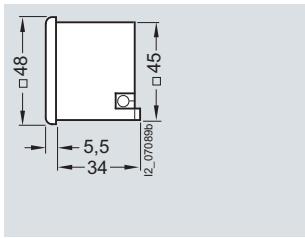

Time counters: Left: counting mechanism, right: counting mechanism with front frame

Time and pulse counters for control cabinets, control and mechanical engineering are used, e.g. in boilers, machine tools or compressors. The pulse counters count the starting frequencies. This supports planning for preventative maintenance.

In-time and regular maintenance is the best protection against unexpected shutdowns.

Measuring Devices and E-counters

Accessories

Current transformers, 7KT1 2

Overview

This three-phase current transformer can be used in distribution boards according to DIN 43880. The measuring leads are routed vertically through the standard mounting rail. This type of current transformer is suitable for supply systems or outgoing conductors in connection with the installation of a 5TE8

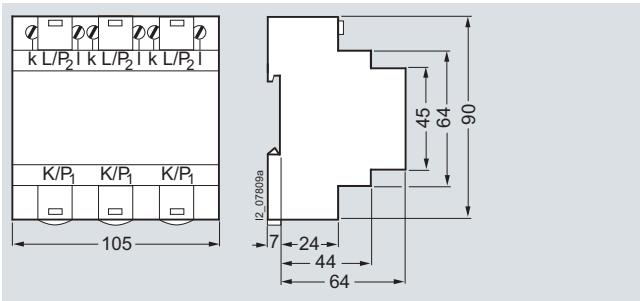

switch or a 5TE1 disconnector, as the primary connecting leads do not have to be interrupted.

The current transformer is designed for cables of up to 13 mm in diameter, e.g. H07V-R with 50 mm² conductor cross-section.

Note:

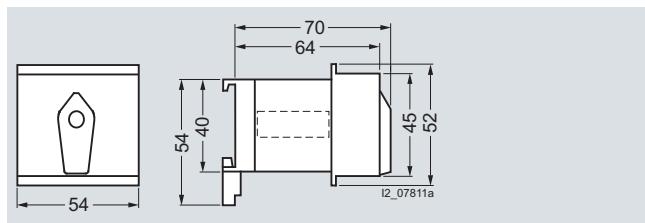

Current transformers must not be operated with open terminals as this can result in dangerously high voltages, which may cause personal injury and/or property damage. It also exposes the transformer to thermal overload.

Measuring selector switches, 7KT9 0

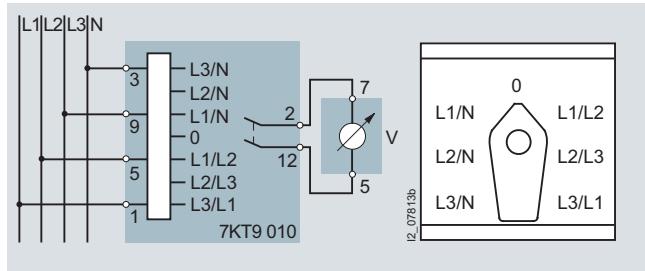

Overview

Measuring selector switches are used as CO contacts of the phases for voltages and currents in three-phase systems for voltmeters and ammeters.

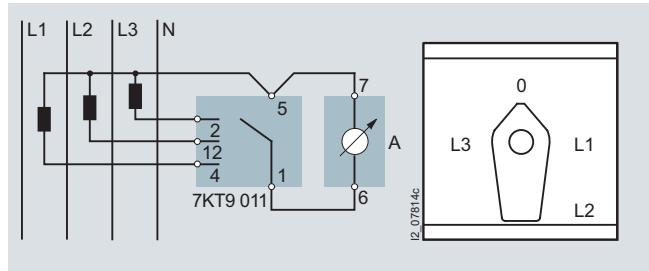

The design of these switches is adapted to match the modular installation devices. They support use in compliance with EN 60947-3.
